

PROJECT MANAGEMENT

2.1 FEASIBILITY STUDY:

2.1.1 Technical Feasibility:

In technical feasibility the main aim is that the system can work with the current man and equipment. Our project can work with current operating system and current configuration so our project is feasible at the view of technical feasibility.

2.1.2 Operational Feasibility:

Our project is satisfied the requirement of operational feasibility. In operational feasibility here are few question for checking the satisfaction of the operational feasibility. In operational feasibility main aim is that the current member can operate the system. Our project can be operatable by any person. So, our project feasible at the point of operational feasibility.

2.1.3 Economical Feasibility:

Economical feasibility benefits the project that it must exceed or at least be equal to the cost of development. It analysis is the most commonly used method for determining the efficiency of a new project. It helps in identifying profit against investment expected from a project. Cost and time are the most essential factors involved in this field of study.

2.2 PROJECT PLANNING:

2.2.1 Project Development Approach & Justification:

How use this model for developing this project

- In the initiation phase, you will define the project. You will sort out the project goals, scope, and resources of the project and what roles are needed on the team. Clarifying what stakeholders expect out of the project, and what exactly the project is aiming to achieve (and why) will give the project and team clear direction.
- In the planning phase, you will determine the steps to actually achieve the project goals—the “how” of completing a project. You will establish budgets, timelines, milestones, source materials, and necessary documents. This step also involves calculating and predicting risk, establishing change processes in place, and outlining communication protocols. If the initiation phase is assembling your troops, the planning phase is deciding what to do with them.
- Executing a project means putting your plan into action and keeping the team on track. Generally, this means tracking and measuring progress, managing quality, mitigating risk, managing the budget, and using data to inform your decisions. Specific steps might include:
 - Using tools like DFD and E-R or burndown charts to track progress on tasks
 - Responding to risks when they manifest

- Recording costs
 - Keeping team members motivated and on task
 - Keeping stakeholders informed of progress
 - Incorporating changes via change requests
- In the closing phase of the project management lifecycle, you will conclude project activities, turn the finished product or service over to its new owners and assess the things that went well and did not go so well. It will also be a time to celebrate your hard work. Steps in the closing phase can include:
 - Conducting retrospectives and take notes of changes you can implement in the future.
 - Communicating to stakeholders at the end of the project and providing an impact report
 - Communicating with the new owners of a project.
 - Creating a project closeout report
 - Celebrating the end of the project and your successes

2.2 PROJECT SCHEDULING:

Scheduling in project management is the listing of activities, deliverables, and milestones within a project. A schedule usually includes a planned start and finish date, duration, and resources assigned to each activity. Effective project scheduling is a critical component of successful time management, especially for professional service businesses.

In this guide, we will explore the concept of scheduling in project management, its importance, and how it is done. We will also look into the different scheduling techniques, tools, and best practices that project managers can leverage to keep their projects on track and deliver successful outcomes.

If you are looking for a tool that will allow you to have full control over the scheduling processes for your projects, Wrike has the right solution for you. You can start today and unlock the full power of project management.

Resources required for Development of Project:

- Human effort
- Sufficient disk space on server
- Specialized hardware
- Software technology
- Travel allowance required by project staff, etc.

Advantages of Project Scheduling:

- It simply ensures that everyone remains on same page as far as tasks get completed, dependencies, and deadlines.
- It helps in identifying issues early and concerns such as lack or unavailability of resources.
- It also helps to identify relationships and to monitor process.
- It provides effective budget management and risk mitigation.
